The methodology used in this tutorial is the same for all the standard shapes tool such as box, rectangle, circle, ellipse, parabola, and hyperbola, but remember that each shape tool has its own options and capabilities. For example, the box tool allows you to change the size of the box by typing a value in a text box. With the circle tool, you can change the radius of the circle. With the box and circle tools, you can change the number of sides for a polygon. For example, you can turn a rectangle into a polygon by increasing the number of sides in the properties palette. Method 1: Create a cylinder with the cylinder tool The Cylinder shape tool is the only shape tool that provides the option to create a hollow cylinder. The Cylinder shape tool draws a hollow cylinder by filling its internal area with solid line segments. The line segments are not connected to one another and will remain visible until you specify the amount of solid fill you want. The default setting for the amount of solid fill is 100%. To create a hollow cylinder, you must make sure that the Amount of fill box is set to 100% and the End fill box is set to 0%. Select the Cylinder tool by pressing the T key. In the Tools panel on the left side of the screen, select Cylinder, as shown in Figure 1. The Cylinder shape tool is a hollow cylinder that will be used to create a watertight tank. Figure 1. Select the Cylinder shape tool. Point and click anywhere in the drawing area to start creating a cylinder. Figure 2. Draw a point to create a cylinder. The Cylinder shape tool draws a hollow cylinder. A hollow cylinder is simply a cylinder with no internal area. To create a cylinder, you need to fill the internal area with solid lines. The default setting for the Cylinder shape tool allows you to create the shape of a circular cone that is capped at the top with a circle. As you can see in Figure 2, you must first draw a point. As you draw a point, the tool will convert the point into a cylinder, assuming the amount of solid fill is set to 100%. Note: It is possible to create multiple

File formats As of 2015, the most common file formats that can be imported into AutoCAD are: DXF DWG DWF MD GIS STEP JPG JPEG Importing from these files can be done via the command line (but does not come with the software) or a user interface that can open a file directly from the operating system. AutoCAD and its ilk can also import and export to many of the other drawing formats, including Adobe Illustrator, Adobe Photoshop, AutoCAD-specific exchange formats such as DWGX and CADDXF, and proprietary formats like ArchiCAD. It can also export to some vector-based drawing formats such as VectorWorks, Visio, and Freehand. Although it can import many formats, AutoCAD does not have a native importing and exporting capability for these formats and they require third-party software. Autocad HDS is a popular importing and exporting option, as well as importing from CAD databases. AutoCAD has the ability to export as many of these formats as it imports. When exporting, AutoCAD can create a DWG file, a DXF file or a DXF+ file. DXF+ files have a technology called I/O Layers that allows each line and point to have a different description. All this information can be stored in an XML file and made available to other programs for manipulation. Drawing-specific features 2D commands and tools 2D drawings - The traditional command line and drafting window interface. 2D drawing commands – Functions to create, edit, modify, open, save, and manage drawings. The two major categories of these are the Drafting commands and the Technical drawing commands. AutoCAD drawing interface – The user interface for editing drafting and technical drawings. The interface in AutoCAD LT is a rudimentary version of this. The main features include navigation through views, placement of objects, hiding objects, and the ability to work with dimensions, styles, text, and other objects. 2D drawing tools – The tools available for editing 2D drawings. XY commands – These functions allow users to move an object in the drawing window and to link it to a point, line, polyline, arc, or polygon. 3D commands – 2D drawing commands used for creating 3D drawings. These can be found on the Technical Drawing tab. 3D drawing commands –

The particular state(s) of the character that you specify will be recreated to that state, in the same way a user is notified when the state of the application changes (display the splash screen, for instance). So, for instance, if you specify "state = 0", then the text in the field that represents the state would be "0" instead of "Null". And if you specify "state = 1", the text would be "1", and so on. If you don't specify any state, then it would not use a state in the first place and therefore it would display the Null value. So what you'll have to do is create some sort of system which displays the data in the field, and displays the Null value if the text in the field is empty, and display the data if the text in the field is not empty.Mayor's office Santa Ana (CA) - Governor Arnold Schwarzenegger signed legislation granting Long Beach police the authority to stop and detain motorists and obtain information at the request of federal officers or agents. The legislation, AB 997, passed the California State Senate by a unanimous vote of 36-0 on Friday, March 23, 2007. "This is a monumental day for Long Beach and the greater Los Angeles area because it will allow the best officers in the world to focus on dangerous criminals," said Mayor Bob Foster. "It's the right thing to do. "We welcome this authority, which had been lost for over 70 years. We are proud of Long Beach's officers for working long and hard to gain this authority," Foster said. Long Beach Police Chief Thomas R. Deeley said, "The law is an important step forward for all law enforcement agencies to protect us in our time of greatest need. It is a reality check for police chiefs in other cities who have fought to take away officers' authority to conduct traffic stops because of political reasons. " Under the new law, officers may stop a motorist if the officer reasonably believes the motorist is violating any federal or state law. The officer may then detain the motorist
